

Based on a **FreshAir Surround** demo at an eye doctor's home...

After seeing what was in the air at her very clean home BEFORE running the FreshAir...then seeing the difference our technology made AFTER 3 days of air purification, she ordered a **Fast Start Essentials Plus Pack** and offered to have a group of her friends together at her home to share the Vollara benefits with all of them!

DEMOS WORK!

The left dish shows what was in her air before the FreshAir was placed in her home. You are seeing the 9-day results. The man who did these tests says the Petri dish on the left looked almost this bad after the first 3 days of incubation.

*The right dish was started after the **FreshAir Surround** had cleaned her home for 3 days. So the contents of this dish had been growing for 6 days when the photo was taken. WHAT A DIFFERENCE!*

The Petri dish test can be done in your home!

A 'before' sample is collected over a 1 to 3 hour period so the microorganisms in your air will have time to land (settle) on the culture. A FreshAir is then placed in the largest open area of your home, where it runs for 3 days. An 'after' sample is then taken (same exposure to your home). Each culture is sealed* and incubated in a dark place.

The cultures may (and probably will) include Staph, other dangerous bacteria and mold. *Do not open the finished dishes, which are dangerous. Keep these cultures out of reach of children. Dispose in a double plastic bag. Unwanted microorganisms live in every home and place of business.

FreshAir technologies keep microbiological levels under control.

The Safety Level Your Home Deserves
